

## Exercises

1. Prepare a PXE server configuration that allows you to install the selected Linux operating system using the network installer. The installation process should run automatically, without the need for user interaction. After installing the operating system, the machine with the new operating system should automatically shut down. The installer should automatically install the selected C/C++ compiler and SSH server
2. Show the configuration of the PXE server that allows the network to boot the operating system stored on the Live CD/DVD
3. Show the configuration of the PXE server that allows the system to boot from a floppy disk over the network. 4. Make changes to the PXE server configuration file to allow the system to boot from the first available hard drive
