

## Exercises

1. For the correct configuration of routers for the RIP / RIPv2 protocol, perform communication tests between machines located in the local networks of the R1 and R2 router (r1\_a and r2\_a networks).
2. Make the configuration changes from Task 1 so that only machines on R1's local network can access the Internet.
3. Make changes to the settings of routers R1 and R2 so that machines on these routers' LANs use different DNS servers.
